

We all started with the urge to build personal AI. For me, it started with *Her* (2013), and the thought of building something that could eventually replace our smartphones and become a new kind of computing device.

That thought became Aura, a wearable AI system I started building myself. I was working across the hardware, software, audio, LLMs, memory, retrieval, agents and backend, and eventually worked solo on most of it. I also contribute to Omi's open-source ecosystem, working on its frontend, security and design, and have spoken with Aryan and Nik Shevchenko as well.

I've also been building my own version of a personal assistant, trying to understand how agents can actually work on our behalf. When I saw NeoSapien, it felt very close to what I've been trying to build myself. The idea of working on personal AI with people building it for real is something I genuinely want to do.
