

Top AI/ML & Voice-AI Roles for SD (India)

1. Total Automation Solutions – AI/ML Engineer (Fresher), Pune. This on-site role involves designing and deploying AI/ML models (e.g. time-series forecasting with TensorFlow/Scikit-Learn) and building GenAI solutions (using ChatGPT/OpenAI APIs) for industrial automation 【107†L55-L64】. It also requires full-stack skills (Python/Flask or Node, React) and data engineering (AWS, Docker, MQTT, etc.)

【107†L88-L100】. My strong Python background and familiarity with ML libraries fit the core requirements, and my interest in generative AI aligns well with the GenAI projects listed 【107†L55-L64】. *Fit Score: 90 (S-Tier – excellent match).*

2. Codvo.ai – System Engineer Intern, Pune (Onsite). This internship welcomes freshers (0–1 yr exp) to work on robotics/AI products. Key tasks include understanding system fundamentals and backend programming (Python preferred) and contributing to AI/ML or computer vision research concepts

【20†L51-L60】 【20†L72-L80】. It emphasizes good problem-solving, Python skills, and academic exposure to AI/ML. I meet these with my Python and ML project experience, and my ability to self-learn would cover any hardware integration aspects. *Fit Score: 88 (S-Tier – strong fit).*

3. Jio Haptik – Voice AI Engineer (Hybrid), Mumbai. This hybrid role (0–4 yrs exp) focuses on building voice-bot systems: integrating speech-to-text and text-to-speech, designing IVR call flows, and improving voice-bot performance 【70†L61-L70】 【70†L67-L73】. Strong skills in backend development (Python/Node/Java) and understanding of conversational AI are required 【70†L67-L73】. My strengths (Python, APIs, generative AI concepts) align with many requirements, but this role also expects familiarity with telephony systems. If I bolster that area, it's a great match in the Voice-AI domain. *Fit Score: 75 (A-Tier – very relevant, minor gap in voice systems).*

4. Voicedots Infotech – Voice AI Engineer (Remote, India). A fully remote role building **AI-powered voice agents** (web and phone) with Python/FastAPI backends and LLM integration 【76†L64-L73】. Responsibilities include developing RAG-based voice systems, speech/telephony integration, and using vector databases for retrieval 【76†L64-L73】 【76†L84-L93】. Required skills are strong Python, RAG/LLM experience, Docker, and knowledge of APIs/vector stores 【76†L98-L106】. My Python/ML expertise and any LLM or RAG project experience would make me a solid candidate, though I may need to learn some specific telephony and vector store tools. *Fit Score: 70 (B-Tier – good match, pay is modest, remote flexibility).*

Other shortlisted roles (not detailed above due to space) include: various AI/ML engineer internships and junior roles in Pune/Bengaluru, focusing on NLP or general AI tasks. The most abundant opportunities aligned with my profile are in Conversational AI/Voice AI roles (like Haptik and Voicedots) and AI/ML Engineering (like Total Automation and Codvo), where Python and ML skills are key.

Summary of Role Categories

- **Voice AI & Conversational AI:** These roles (e.g. at Haptik, Voicedots) involve building IVR/voice-bot systems, integrating speech and LLMs, and are among the most plentiful matching my interests.
- **AI/ML Engineer:** Generalist AI jobs (like at Total Automations) focus on ML models, data pipelines, and cloud deployment. Many startups and SMEs hire freshers here.

- **Generative AI / RAG / LLM Engineering:** Intern roles (e.g. Seagate's ML GenAI internship, if open) target LLM-based analytics. These are fewer but highly relevant for future growth.
- **Software/Backend Engineer (Python):** Several entry roles involving Python backend development for AI applications. These capitalize on my coding skills even if not pure "AI research."

Overall, **Conversational/Voice AI** and **AI/ML engineering** roles currently show the most opportunities matching a fresher profile with my skills.

Recurring Skill Gaps

Across the targeted roles, common gaps that could hinder applications include:

- **Telephony/Voice Systems:** Many Voice AI roles expect familiarity with telephony frameworks (SIP, IVR platforms, Twilio/Exotel) and real-time audio streaming. If not already skilled here, I should highlight any related projects or learn these fundamentals.
- **Generative AI & RAG Tools:** Roles mention LLM integration (OpenAI, LangChain) and vector databases (FAISS, Pinecone) [76†L64-L73] [76†L98-L106] . If my projects haven't used these, that's a gap; I should upskill on prompt engineering and document retrieval systems.
- **Cloud & Deployment:** Several jobs require Docker/Kubernetes or cloud deployment (AWS, Azure) [107†L75-L83] [76†L98-L106] . If experience is limited to local dev, I may need to emphasize quick learning or highlight related coursework.
- **Full-Stack/Frontend:** Some roles (TAS) ask for React or UI work [107†L75-L83] . If my projects were backend-only, mentioning collaborative projects or willingness to learn front-end could help.
- **Domain Knowledge:** Industrial roles (TAS) list IoT/SCADA protocols [107†L75-L83] ; Haptik expects telecom domain familiarity [70†L67-L73] . These specialized areas may not be in my background, so I'd position my generic programming and AI skills as transferable strengths.

Sources: The role details above were verified from official and aggregator postings (e.g. Total Automation Solutions [107†L55-L64] [107†L88-L100] , Codvo.ai [20†L51-L60] [20†L72-L80] , Jio Haptik [70†L61-L70] [70†L67-L73] , Voicedots Infotech [76†L64-L73] [76†L98-L106]). These confirmed the current openings, experience levels, and technical requirements.
